01 Introduction

In the rapidly changing crypto space, being innovative and adaptable is key to success. Ethereum ETF (ETHETF), an Ethereum blockchain-based ERC-20 token, is not just a typical cryptocurrency; it's a forward-thinking project anticipating the approval and launch of Ethereum ETFs. It offers the community a unique chance to benefit from these significant upcoming crypto events. This whitepaper outlines ETHETF's mechanics, strategies, and standout features in the crypto landscape.

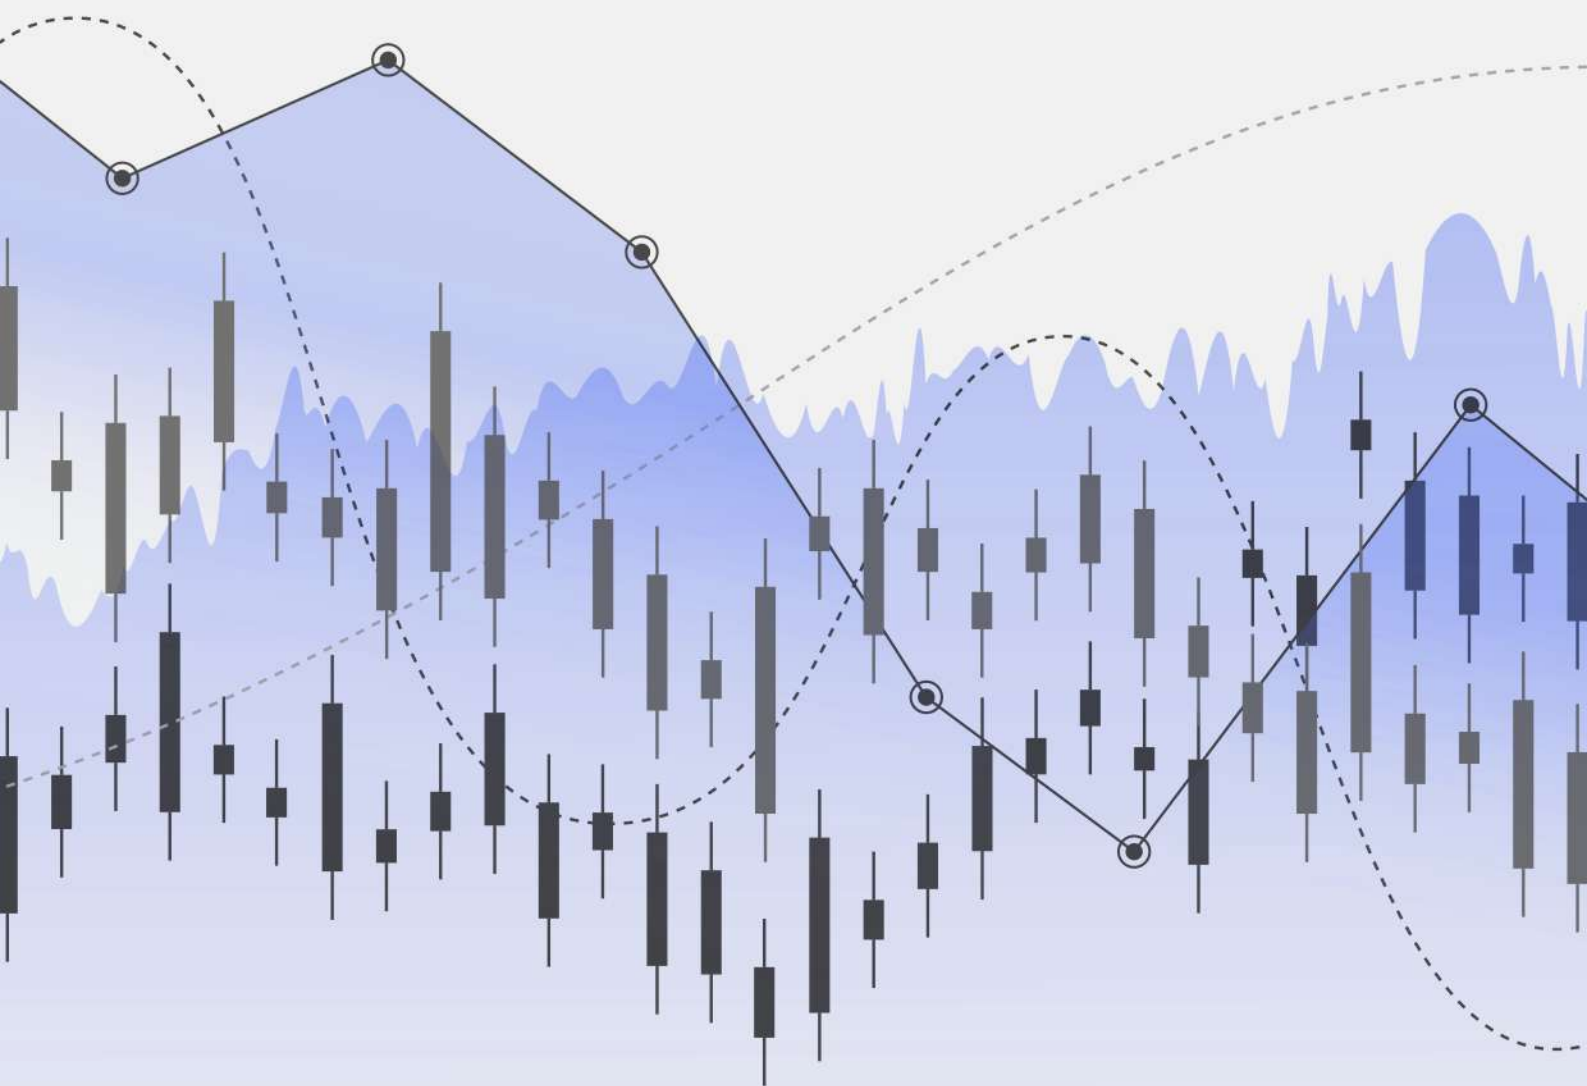

02 The Ethereum ETF Rush

For years, investors have been buzzing with excitement about the potential of an Ethereum Exchange-Traded Fund (ETF). This Ethereum ETF makes it easier for people in the stock market to invest in Ethereum. Instead of dealing with the complicated technical stuff of buying and holding Ethereum directly, traders can buy shares that represent it through regular brokerage accounts. Big investment leaders, like BlackRock, add an extra layer of excitement by vouching for the inevitable arrival of Ethereum ETFs, signaling a future rush of approval and launch of different ETFs from regulatory bodies like the Securities and Exchange Commission (SEC). If these ETFs get approved, a lot of money - billions of dollars - could flow into the crypto market. This makes it a thrilling investment opportunity.

03 The ETHETF Presale

The presale stage for ETHETF holds significant importance, strategically aimed at building a strong community base. In this phase, 40% of the total tokens (48 million ETHETF) are available at \$0.005 each, with an initial market cap of \$6,000,000, offering early supporters a favorable entry point before the anticipated surge of excitement surrounding ETF approvals.

04 Staking Utility of ETHETF

ETHETF isn't just an anticipatory measure for the Ethereum ETF wave – it's also a utility token that lets holders earn rewards by staking. We've set aside a quarter of all the tokens for staking rewards, encouraging holders to stake and support network security. All the details, including how rewards are calculated and the timeframe, will be transparently shared on our official platform.

05 Tokenomics of ETHETF

ETHETF's tokenomics is carefully designed to decrease the supply and boost value for token holders strategically. There are 120,000,000 ETHETF tokens in total, distributed into 4 sectors i.e. presale, staking rewards, liquidity, and token burning.

- **Presale** 40%
- **Staking** 25%
- **Burn** 25%
- **Liquidity** 10%

To decrease the token supply over time, each transaction has a 5% burn tax. The goal is to burn 25% of the total tokens as the project hits specific milestones. This strategy benefits long-term holders and reduces the selling pressure.

06 Roadmap

Presale: The Birth of ETHETF

Our initial focus is on bringing the ETHETF community together and spreading awareness about our goal to help everyone get ETHETF tokens before the first Ethereum ETF approval. A fair presale builds a strong community.

Pre-Launch: ETHETF Marketing

During the presale, we're starting marketing efforts that explain why it's important to hold ETHETF tokens and ETH before the SEC approves the first Ethereum ETF, highlighting its significance.

ETHETF: Launch and 5% Burn Tax

Once launched on a DEX, the token-burning process will automatically reduce the token supply with each transaction, making the remaining token supply scarcer. The transaction tax will decrease 1% each time we reach a milestone in the Ethereum ETF journey.

25% Token Burn: Overtime

As Ethereum grows in the global market, we plan to burn and remove a total of 25% ETHETF token supply from circulation. With each ETHETF milestone, 5% of the total supply will be burned step by step.

07 Milestones

ETHETF roadmap is like a timeline of important milestones and strategic stages, starting with the presale and going up to key moments in the Ethereum and global financial markets. The success of the project depends on these steps:

01 \$100M Trading Volume

When ETHETF's total trading volume reaches \$100 million, it shows that ETHETF is making its mark in the market. At this point, 5% of the total tokens will be removed, making the supply smaller. The transaction tax will also go down from 5% to 4%

02

First ETF Approval

This is a big moment for everyone waiting for ETHETF. It's when the SEC gives the green light for the first Ethereum ETF. 5% of the total tokens will be burned, and the transaction tax will decrease from 4% to 3%.

03

ETF Launch Date

This is when the first Ethereum ETF starts trading. It's when people can see the impact of ETHETF on the market. 5% of the total tokens will be burned, and the transaction tax will go down from 3% to 2%.

04 ETF Assets \$1 Billion

This is a sign that many people are using Ethereum ETFs. When the total value of assets reaches \$1 billion, we will celebrate this milestone with another token burn event. 5% of the total tokens will be burned, and the transaction tax will decrease from 2% to 1%.

05 \$10K ETH Price

This milestone represents Ethereum's strength. When the price of one Ethereum goes above \$10,000, it's a symbol of stability. 5% of the total tokens will be burned, and the transaction tax will go down from 1% to 0%.

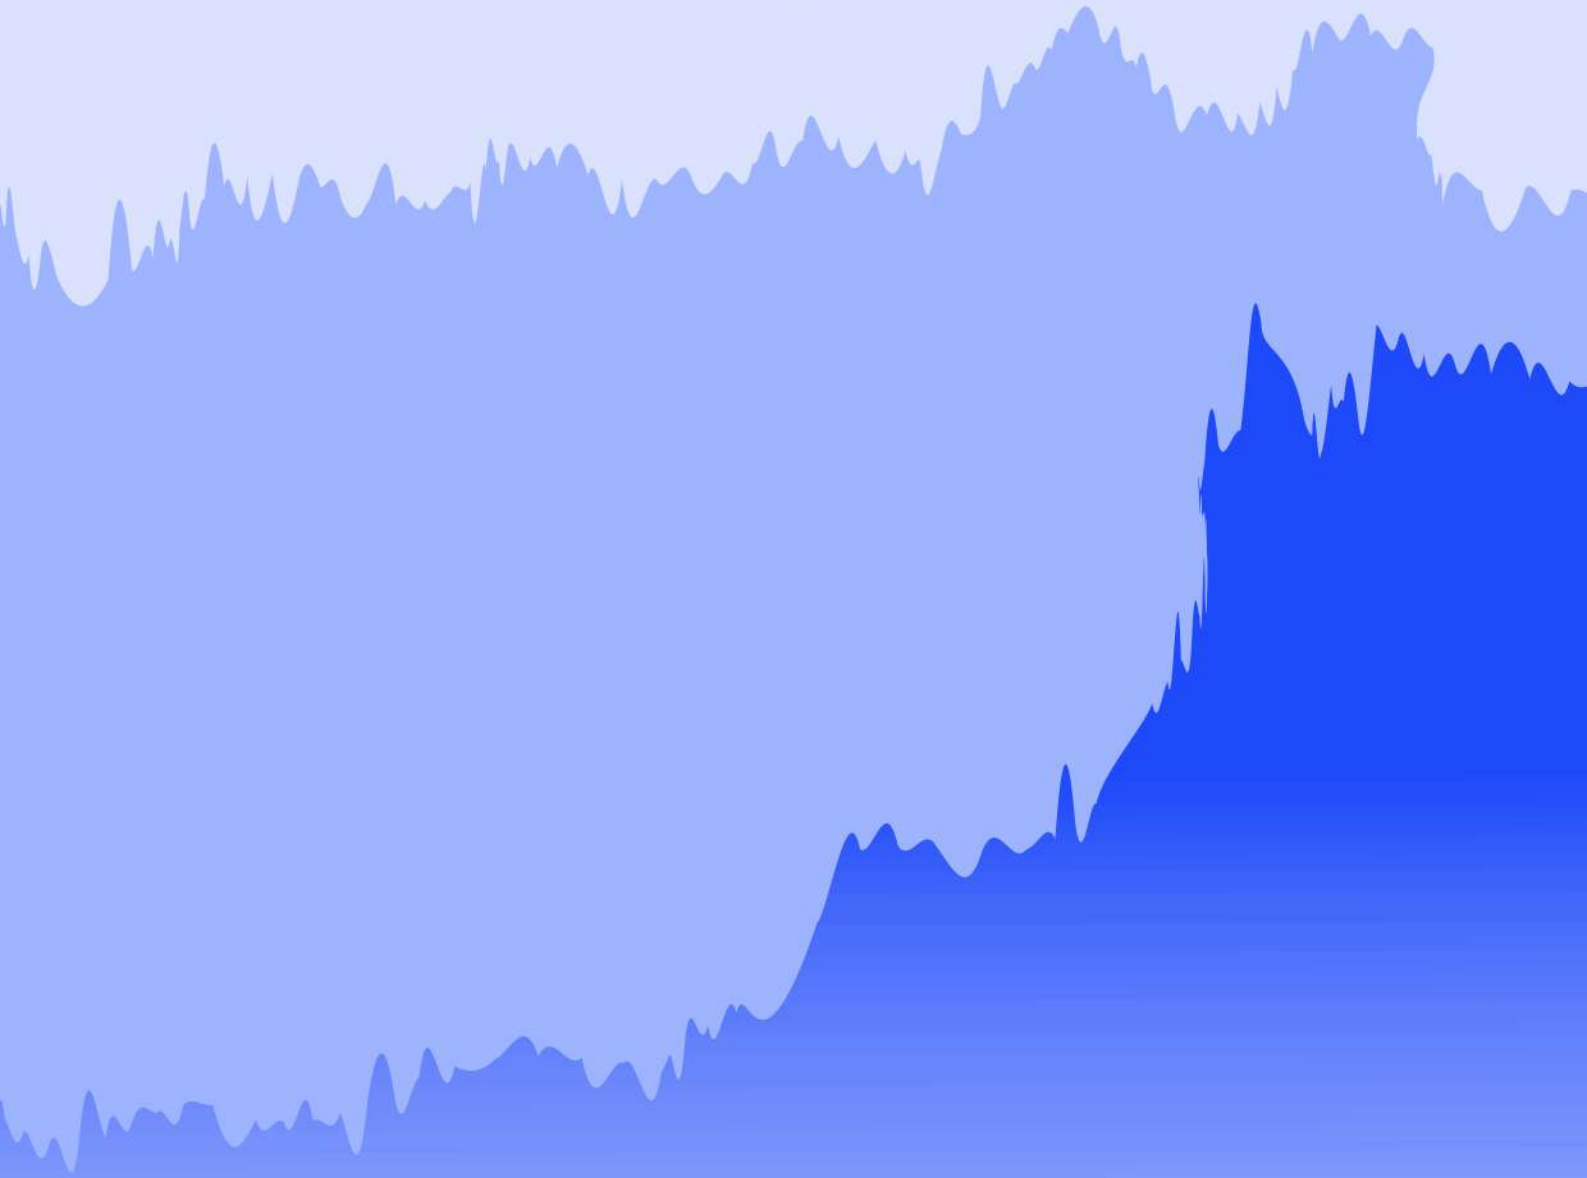

At each step, 5% of the total tokens supply will be removed, reducing the number of tokens in circulation and potentially increasing the token's value, benefiting its holders.

08 Disclaimer

This whitepaper serves just for information purposes. It does not constitute investment advice. It's important to consult with financial advisors before making any decisions. Investing in cryptocurrencies comes with high risks, including unpredictable market swings and the potential loss of your investment. Participants are responsible for complying with local laws and regulations. The ETHETF team does not assure profits and is not liable for investment losses. Purchases of ETHETF should only be made with legal tender or accepted cryptocurrencies. Any illegal use of ETHETF by all entities or individuals is strictly forbidden.
